

Propose. Prove. Execute.

An autonomous options agent that cannot risk a dollar until it writes why the trade exists, when it is wrong, and the maximum amount it can lose.

AI LOGIC

A 29-symbol deterministic scout ranks liquid stocks and sector ETFs, probes options only for the top five, and advances at most three candidates. Grok returns a structured, falsifiable thesis through a request tool. It never selects final contracts, sizes risk, reads the account clock, or submits an order.

DETERMINISTIC RISK

Code rebuilds a call or put debit vertical, refreshes both leg quotes, and enforces paper-only access, active account, options level 3, 14-45 DTE, quote quality, contract identity, market hours, position limits, $\leq 2\%$ equity risk per thesis, $\leq 6\%$ aggregate risk, and explicit execution enablement.

OFFICIAL ALPACA MCP

The official Alpaca MCP server is the agent tool boundary. `place_option_order` is the only write path; there is no CLI or SDK write fallback. Timeout, malformed response, missing order ID, rejection, or an ambiguous result is terminal and never retried. Trading and Market Data APIs provide account, quotes, orders, fills, positions, and portfolio history.

JUDGE EVIDENCE

The public FastAPI console is read-only. It reconciles an append-only SQLite decision ledger with live Alpaca paper data and exposes the thesis, every gate, sanitized MCP trace, exact multi-leg intent, broker state, fills, linked positions, realized and unrealized P&L, reconciliation delta, and equity curve. A no-trade remains auditable evidence.

WHY THESIS

Evidence over assertion. Grok is creative where language is useful and powerless where deterministic controls are safer. Every trade—and every refusal to trade—is explainable from one public, read-only screen.
